

PROCESS OPTIMIZATION

Many companies struggle with finding the right mix of talented people, efficient processes and the latest technologies. Anchin Digital Risk Solutions (ADRS) has extensive experience helping organizations assess how they can improve their operations using our AI-based technology.

We deliver solutions that streamline operations while enforcing quality and compliance standards. Our solutions have the capability to automate the capture management's mindset from internal documentation and data through which we build computerized simulation models. These models allow our team and yours to "see" the most optimized and controlled business processes.

Unlike traditional data-driven implementation, our solutions deliver business value by improving mapping, reducing time-to-value for the investment in enterprise systems, and identifying business unit processes that should be promoted across the enterprise.

Capabilities

Our capabilities include the ability to:

Rapidly assess, document and understand business processes

Identify opportunities to improve those processes using automated tools

Optimize the necessary human support

Innovate the way work gets done

Where do we start?

Every improvement project begins with **pre-assessment planning** followed by a detailed **assessment/operational analysis**. If you don't know what your company's situation is, you can never improve it. We help our clients rapidly document and understand their business processes and identify opportunities to improve those processes using automated tools.

With automation, processes can perform in ways that optimize the amount of human support needed. This shift—moving the burden of processes from humans to technology—has the potential to redesign the way work gets done within your organization. Simple automation of processes can **eliminate errors, reduce biases** and perform transactional work **in a fraction of the time** it takes humans. These robotic process automation techniques have now evolved into intelligent interactions and processes.

ADRS provides the talent and the technology to transform processes, enhance outputs and generate results, with proven gains on efficiency and timeliness over our competitors. We transform data and content into insights and evidence, capture knowledge and expertise in a computable form as an organizational asset, and automate complex knowledge-worker processes.

Our solutions identify efficiencies

Capture and synthesize expertise across the organization

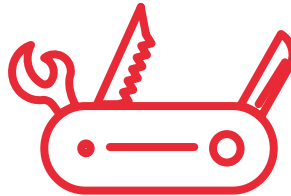

Cross-analyze people, process, technology, regulations & policies

Discover gaps in risk, control, process and policy coverage

Re-engineer operations with a unified vision and deployment

Use of agile and adaptable business solutions

Provide efficient and dynamic results

Solution Deployment

Models are constructed in agile iterations. The iteration is the prototype, built using sample core data and implementing one or more key functions. Generally, the prototype is scoped to enable project sponsors to visualize how the critical success factors and the fundamental business case will be achieved. Typically, the prototype is delivered in 2-3 weeks.

CLIENT SUCCESS

Accounting Process Automation

A client struggled with managing accounting for its philanthropic grants. With the implementation of a new general ledger the use and analysis of this information has become more critical and beyond the current workarounds that have been band-aiding the effort for years. A solution was built in four weeks that enabled the automation of the ingestion of the grant data into the new general ledger. What was over an 80 hour per month exercise was reduced to under 2 hours.

Call Center Re-engineering

A major metropolitan city sought to re-engineer its call center to reduce the average wait time and maintain compliance with the seven day resolution regulatory requirement. The solution was able to overcome an inflexible budget, a hard deadline and a history of project overrun to help the client accomplish its goals.
